Dhanush $= \frac{1}{3} - \frac{1}{8} = \frac{8-3}{24} = \frac{5}{24}$

Share of new partner

Arun $= \frac{1}{4}$

In order to equate, multiply and divide Arun's share by 6

$$= \frac{1}{4} \times \frac{6}{6} = \frac{6}{24}$$

New profit sharing ratio of Mahesh, Dhanush and Arun $= \frac{13}{24} : \frac{5}{24} : \frac{6}{24}$ that is, 13:5:6.

(c) When share sacrificed and proportion of share sacrificed is not given

When new profit sharing ratio, share sacrificed and the proportion of share sacrificed is not given, but only the share of new partner is given, new profit sharing ratio is calculated by assuming that the share sacrificed is the proportion of old share. New profit sharing ratio is calculated as follows:

Share sacrificed	= New partner's share x Old share
New share of old partner	= Old share - Share sacrificed

Illustration 16

Vimal and Athi are partners sharing profits in the ratio of 2:1. Jeyam is admitted for 1/4 share in the profits. Calculate the new profit sharing ratio and sacrificing ratio.

Solution

Computation of sacrificing ratio and new profit sharing ratio

Since share sacrificed, proportion of share sacrificed and new profit sharing ratio are not given, it is assumed that the existing partners sacrifice in their old profit sharing ratio, that is, 2:1.

Sacrificing ratio of Vimal and Athi is 2:1

Let the total share be 1

Jeyam's share $= \frac{1}{4}$

Remaining share $= 1 - \frac{1}{4} = \frac{4-1}{4}$

$$= \frac{3}{4}$$

New share of old partners = Remaining share × Old share

Vimal $= \frac{3}{4} \times \frac{2}{3} = \frac{6}{12}$

Athi $= \frac{3}{4} \times \frac{1}{3} = \frac{3}{12}$
