Iteration	i	while i >= -4	print (Marks[i])	i = i + -1
1	-1	-1 >= -4 True	Marks[-1] = 75	-1 + (-1) = -2
2	-2	-2 >= -4 True	Marks[-2] = 41	-2 + (-1) = -3
3	-3	-3 >= -4 True	Marks[-3] = 23	-3 + (-1) = -4
4	-4	-4 >= -4 True	Marks[-4] = 10	-4 + (-1) = -5
5	-5	-5 >= -4 False	--	--

9.1.3 List Length

The **len()** function in Python is used to find the length of a list. (i.e., the number of elements in a list). Usually, the **len()** function is used to set the upper limit in a loop to read all the elements of a list. If a list contains another list as an element, **len()** returns that inner list as a single element.

Example :Accessing single element

```
>>> MySubject = [“Tamil”, “English”, “Comp. Science”, “Maths”]
>>> len(MySubject)
    4
```

Example : Program to display elements in a list using loop

```
MySubject = ["Tamil", "English", "Comp. Science", "Maths"]
i = 0
while i < len(MySubject):
        print (MySubject[i])
        i = i + 1
```

Output

```
Tamil
English
Comp. Science
Maths
```

9.1.4 Accessing elements using for loop

In Python, the ***for*** loop is used to access all the elements in a list one by one. This is just like the ***for*** keyword in other programming language such as C++.

Syntax:

```
for index_var in list:
    print (index_var)
```
