### 9.2.2 Creating Tuples

Creating tuples is similar to list. In a list, elements are defined within square brackets, whereas in tuples, they may be enclosed by parenthesis. The elements of a tuple can be even defined without parenthesis. Whether the elements defined within parenthesis or without parenthesis, there is no differente in it's function.

**Syntax:**

*# Empty tuple*

***Tuple_Name = ( )***

*# Tuple with n number elements*

***Tuple_Name = (E1, E2, E2 ……. En)***

*# Elements of a tuple without parenthesis*

***Tuple_Name = E1, E2, E3 ….. En***

**Example**

```
>>> MyTup1 = (23, 56, 89, 'A', 'E', 'I', "Tamil")
>>> print(MyTup1)
        (23, 56, 89, 'A', 'E', 'I', 'Tamil')

>>> MyTup2 = 23, 56, 89, 'A', 'E', 'I', "Tamil"
>>> print (MyTup2)
        (23, 56, 89, 'A', 'E', 'I', 'Tamil')
```

#### (i) Creating tuples using tuple( ) function

The **tuple()** function is used to create Tuples from a list. When you create a tuple, from a list, the elements should be enclosed within square brackets.

**Syntax:**

*Tuple_Name = tuple( [list elements] )*

**Example**

```
>>> MyTup3 = tuple( [23, 45, 90] )
>>> print(MyTup3)
        (23, 45, 90)
>>> type (MyTup3)
        <class 'tuple'>
```
