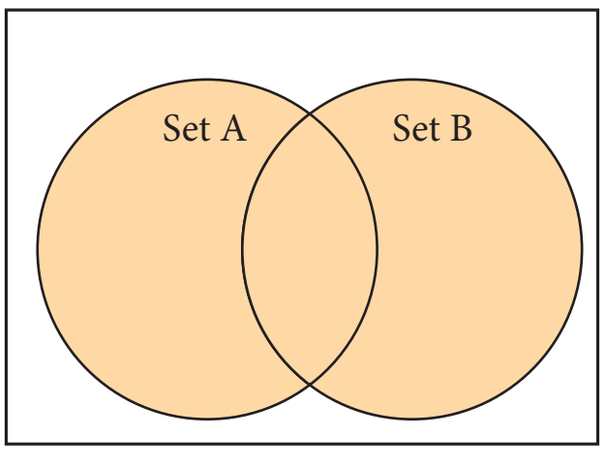
9.3.3 Set Operations

As you learnt in mathematics, the python is also supports the set operations such as Union, Intersection, difference and Symmetric difference.

(i) Union: It includes all elements from two or more sets



In python, the operator | is used to union of two sets. The function **union()** is also used to join two sets in python.

Example: Program to Join (Union) two sets using union operator

```
set_A={2,4,6,8}
set_B={'A', 'B', 'C', 'D'}
U_set=set_A|set_B
print(U_set)
```

Output:

```
{2, 4, 6, 8, 'A', 'D', 'C', 'B'}
```

Example: Program to Join (Union) two sets using union function

```
set_A={2,4,6,8}
set_B={'A', 'B', 'C', 'D'}
set_U=set_A.union(set_B)
print(set_U)
```

Output:

```
{'D', 2, 4, 6, 8, 'B', 'C', 'A'}
```
