Example : Program to access all the values stored in a dictionary

```
MyDict = {      'Reg_No': '1221',
                'Name' : 'Tamilselvi',
                'School' : 'CGHSS',
                'Address' : 'Rotler St., Chennai 112' }
print(MyDict)
print("Register Number: ", MyDict['Reg_No'])
print("Name of the Student: ", MyDict['Name'])
print("School: ", MyDict['School'])
print("Address: ", MyDict['Address'])
```

Output:

```
{'Reg_No': '1221', 'Name': 'Tamilselvi', 'School': 'CGHSS', 'Address': 'Rotler St., Chennai 112'}
Register Number:  1221
Name of the Student:  Tamilselvi
School:  CGHSS
Address:  Rotler St., Chennai 112
```

Note that, the first print statement prints all the values of the dictionary. Other statements are printing only the specified values which is given within square brackets.

In an existing dictionary, you can add more values by simply assigning the value along with key. The following syntax is used to understand adding more elements in a dictionary.

dictionary_name [key] = value/element

Example : Program to add a new value in the dictionary

```
MyDict = {      'Reg_No': '1221',
                'Name' : 'Tamilselvi',
                'School' : 'CGHSS', 'Address' : '
                Rotler St., Chennai 112'}
print(MyDict)
print("Register Number: ", MyDict['Reg_No'])
print("Name of the Student: ", MyDict['Name'])
MyDict['Class'] = 'XII - A'                 # Adding new value
print("Class: ", MyDict['Class'])           # Printing newly added value
print("School: ", MyDict['School'])
print("Address: ", MyDict['Address'])
```

Modification of a value in dictionary is very similar as adding elements. When you assign a value to a key, it will simply overwrite the old value.

In Python dictionary, del keyword is used to delete a particular element. The **clear()** function is used to delete all the elements in a dictionary. To remove the dictionary, you can use del keyword with dictionary name.
