Note

The sorted() method sorts the elements of a given item in a specific order – Ascending or Descending. Sort() method which performs the same way as sorted(). Only difference, sort() method doesn't return any value and changes the original list itself.

Add one more column "cost" in "sample8.csv" and sort it in descending order of cost by using the syntax
sortedlist = sorted(data, key=operator.itemgetter(Col_number),reverse=True)

13.6.6 Reading CSV File Into A Dictionary

To read a CSV file into a dictionary can be done by using **DictReader** method of csv module which works similar to the reader() class but creates an object which maps data to a dictionary. The keys are given by the fieldnames as parameter. **DictReader** works by reading the first line of the CSV and using each comma separated value in this line as a **dictionary key.** The columns in each subsequent row then behave like dictionary values and can be accessed with the appropriate key (i.e. fieldname).

If the first row of your CSV does not contain your column names, you can pass a fieldnames parameter into the DictReader's constructor to assign the dictionary keys manually.

The main difference between the csv.reader() and DictReader() is in simple terms csv. reader and csv.writer work with **list/tuple,** while csv.DictReader and csv.DictWriter work with dictionary. csv.DictReader and csv.DictWriter take additional argument fieldnames that are used as dictionary keys.

For Example Reading "sample8.csv" file into a dictionary

```
import csv
filename = 'c:\pyprg\sample8.csv'
input_file =csv.DictReader(open(filename,'r'))
for row in input_file:
    print(dict(row))                    #dict() to print data
```

OUTPUT

```
{'ItemName ': 'Keyboard ', 'Quantity': '48'}
{'ItemName ': 'Monitor', 'Quantity': '52'}
{'ItemName ': 'Mouse ', 'Quantity': '20'}
```

In the above program, DictReader() is used to read "sample8.csv" file and map into a dictionary. Then, the function dict() is used to print the data in dictionary format without order.
