Points to remember:

- The dot (.) operator is used to access the functions of a imported module
- sys module provides access to some variables used by the interpreter and to functions that interact with the interpreter
- OS module in Python provides a way of using operating system dependent functionality
- The getopt module of Python helps you to parse (split) command-line options and arguments

Hands on Experience

1. Write a C++ program to create a class called Student with the following details

Protected member

Rno integer

Public members

void Readno(int); to accept roll number and assign to Rno

void Writeno(); To display Rno.

The class Test is derived Publically from the Student class contains the following details

Protected member

Mark1 float

Mark2 float

Public members

void Readmark(float, float); To accept mark1 and mark2

void Writemark(); To display the marks

Create a class called Sports with the following detail

Protected members

score integer

Public members

void Readscore(int); To accept the score

void Writescore(); To display the score

The class Result is derived Publically from Test and Sports class contains the following details

Private member

Total float
