- COUNT()
- AVG()
- SUM()
- MAX()
- MIN()

15.7.1 COUNT() function

The SQL COUNT() function returns the number of rows in a table satisfying the criteria specified in the WHERE clause. COUNT() returns 0 if there were no matching rows.

Example 15.7.1-1

Example 1 : In this example we are going to count the number of records(rows)

```
import sqlite3
connection = sqlite3.connect("Academy.db")
cursor = connection.cursor()
cursor.execute("SELECT COUNT(*)  FROM student ")
result = cursor.fetchall()
print(result)
```

Output:

```
[(7,)]
```

EXAMPLE 15.7.1-2

Example 2 : In this example we are going to count the number of records by specifying a column

```
import sqlite3
connection = sqlite3.connect("Academy.db")
cursor = connection.cursor()
cursor.execute("SELECT COUNT(AVERAGE)  FROM student ")
result = cursor.fetchall()
print(result
```

Output:

```
[(7,)]
```

Note

NULL values are not counted. In case if we had null in one of the records in student table for example in Average field then the output would be 6
