15.10 Data input by User

In this example we are going to accept data using Python input() command during runtime and then going to write in the Table called "Person"

Example 15.10 -1

```
# code for executing query using input data
import sqlite3
# creates a database in RAM
con =sqlite3.connect("Academy.db")
cur =con.cursor()
cur.execute("DROP Table person")
cur.execute("create table person (name, age, id)")
print("Enter 5 students names:")
who =[input() for i in range(5)]
print("Enter their ages respectively:")
age =[int(input()) for i in range(5)]
print("Enter their ids respectively:")
p_id =[int(input())for i in range(5)]
n =len(who)
for i in range(n):
# This is the q-mark style:
        cur.execute("insert into person values (?, ?, ?)", (who[i], age[i], p_id[i]))
cur.execute("select * from person")
# Fetches all entries from table
print("Displaying All the Records From Person Table")
print (*cur.fetchall(), sep='\n' )
```
