❖ Increased Opportunity in Agricultural Employment

Due to intensive cropping throughout the year, the demand for agricultural employment increased. The demand was felt in two groups namely, unskilled agrarian labour to work in the farm and qualified agricultural engineers and experts to help and facilitate the knowledge regarding scientific farming.

❖ Agriculture, Industry and Market

The Green Revolution in India not only brought a change in agricultural activity, but also brought a healthy relationship between market and industry. As the scientific farming was more dependent on agricultural engineering such as farm equipments, tractors etc., industries began to show interest to produce farm equipments to suit the increasing demand at low cost. At the same time the market also began to play effective role in processing and supplying the products to the consumers.

❖ Inter State Exchange and Market Mechanism

One of the major problem faced by the states in India was that the Green Revolution was beneficial only to those states where the soil was fertile. Hence, states that produced in excess distributed their output to other states which were climatically dry such as Vidarbha and Telangana. Hence, inter-state agrarian market began to grow to cater the needs of the consumption. Concequently, the import burden came down drastically.

❖ Disparity between small farmers and big farmers

Farmers holding very small pieces of land had to compete with the large land holders with regard to finance, infrastructure and agrarian market forces. This led to marginalization of farmers and they were disinterested towards new techniques in farming. Hence, there was variations among farmers and also variation in various regions across India.

❖ Mass Movement

Green Revolution brought majority of farming community in India together both for their personal and national socio-economic welfare. This led to substantial increase in income status of the farming community as the high yield of food grain led high income. Agricultural market also played crucial role in creating competitive pricing which helped the farming community to sell their goods in the open market. Hence, the whole farming community in India took part in the Green Revolution. Unlike industrialization, agriculture showed very short term profit and growth. Hence, it articulated the revolutionary feeling among the agrarian community to actively participate in the Green Revolution.

Major Shortfalls of the Green Revolution

The following factors have been the shortfalls due to Geo-Climatic factors in India.

1. Regional, crop and farming variations.
2. Widened the gap between rich and poor agriculturist.
3. Lack of finance among small scale farmers to put up with initial investment
4. It forced the farmers to use harmful fertilizers and pesticides to increase the crop output.
5. Lack of socialization and preparedness with regard to adopting new technology.
6. It has become a never ending process due lack of adequate check on population overgrowth.
