4) Perkins' reaction

When an aromatic aldehyde is heated with an aliphatic acid anhydride in the presence of the sodium salt of the acid corresponding to the anhydride, condensation takes place and an α, β unsaturated acid is obtained. This reaction is known as **Perkin's reaction**.

Example:

5) Knoevenagal reaction

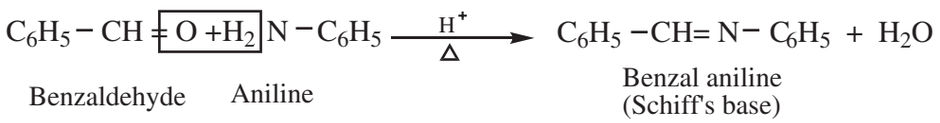

Benzaldehyde condenses with malonic acid in presence of pyridine forming cinnamic acid, Pyridine act as the basic catalyst.

6) Reaction with amine

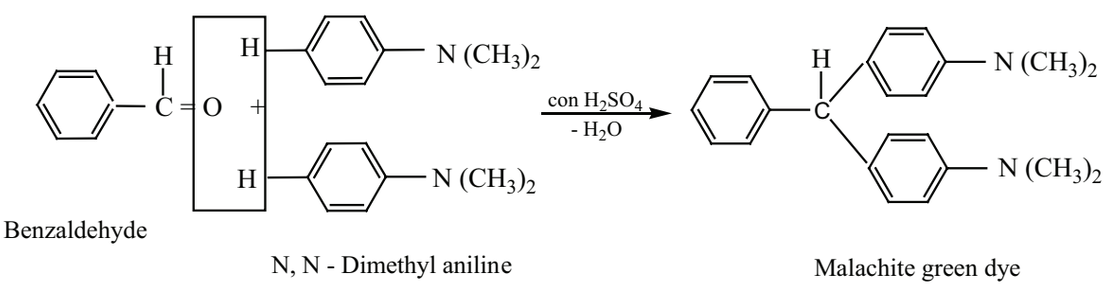

Aromatic aldehydes react with primary amines (aliphatic or aromatic) in the presence of an acid to form **schiff's base**.

Example

7) Condensation with tertiary aromatic amines

Benzaldehyde condenses with tertiary aromatic amines like N, N – dimethyl aniline in the presence of strong acids to form triphenyl methane dye.
