High Spin Complex	Low spin complex
Electronic configuration(for high spin complex) : $t_{2g}^3 e_g^2$ CFSE = {[3(-0.4)+2 (0.6)] Δ_o + 0 × P} - {0} = 0	Electronic configuration (for low spin complex) : $t_{2g}^5 e_g^0$ CFSE = {[5(-0.4)+0 (0.6)] Δ_o + 2 × P} - {0} = -2 Δ_o + 2P = (-2 ×14000) + (2× 30000) = 32000 cm^{-1} High positive CFSE value indicates that low spin complex is not a favourable one.
Actual nature of $[Fe(H_2O)_6]^{3+}$	High spin (Spin free)
Electronic configuration of central metal ion	$t_{2g}^3 e_g^2$
Magnetic property	No. of unpaired electrons = 5; Hence paramagnetic
Magnetic moment (Using spin only formula)	$\mu_s = \sqrt{n(n+2)} = \sqrt{5(5+2)} = 5.916$ BM

Complex: $[Fe(CN)_6]^{3-}$

High Spin Complex	Low spin complex
Electronic configuration in isotropic field : d5 ↑ ↑ ↑ ↑ ↑ No. of paired electrons (n'p)= 0 ; Therefore, E_{iso} = 0	
Ligand field: Electronic configuration : $t_{2g}^3 e_g^2$ CFSE = {[3(-0.4)+2 (0.6)] Δ_o + 0 × P} - {0} = 0	Ligand field Electronic configuration : $t_{2g}^5 e_g^0$ CFSE = {[5(-0.4)+0 (0.6)] Δ_o + 2 × P} - {0} = -2 Δ_o + 2P = (-2 ×35000) + (2× 30000) = -10000 cm^{-1} Negative CFSE value indicates that low spin complex is favoured
