SUMMARY

- Like charges repel and unlike charges attract.
- The total charge in the universe is conserved.
- Charge is quantized. Total charge in an object $q = ne$ where $n = 0,1,2,3\ldots$ and e is charge of the electron.
- Coulomb's law in vector form: $\vec{F} = \frac{1}{4\pi\epsilon_\circ}\frac{q_1 q_2}{r^2}\hat{r}$ ($\hat{r}$ is unit vector along joining q_1, q_2).
- Electrostatic force obeys the superposition principle.
- Electric field at a distance r from a point charge: $\vec{E} = \frac{1}{4\pi\epsilon_\circ}\frac{q}{r^2}\hat{r}$.
- Electric field lines starts at a positive charge and end at a negative charge or at infinity.
- Electric field due to electric dipole at points on the axial line : $\vec{E}_{tot} = \frac{1}{4\pi\epsilon_\circ}\left(\frac{2\vec{p}}{r^3}\right)$.
- Electric field due to electric dipole at points on the equatorial line: $\vec{E}_{tot} = -\frac{1}{4\pi\epsilon_\circ}\left(\frac{\vec{p}}{r^3}\right)$.
- Torque experienced by a dipole in a uniform electric field: $\vec{\tau} = \vec{p}\times\vec{E}$.
- Electrostatic potential at a distance r from the point charge: $V = \frac{1}{4\pi\epsilon_\circ}\frac{q}{r}$.
- Electrostatic potential due to an electric dipole: $V = \frac{1}{4\pi\epsilon_\circ}\frac{\vec{p}\cdot\hat{r}}{r^2}$.
- The electrostatic potential is the same at all points on an equipotential surface.
- The relation between electric field and electrostatic potential:

$$\vec{E} = -\left(\frac{\partial V}{\partial x}\hat{i} + \frac{\partial V}{\partial y}\hat{j} + \frac{\partial V}{\partial z}\hat{k}\right).$$

- Electrostatic potential energy for system of charges is equal to the work done to arrange the charges in the given configuration.
- Electrostatic potential energy of a dipole system in a uniform electric field: $U = -\vec{p}\cdot\vec{E}$.
- The total electric flux through a closed surface : $\Phi_E = \frac{Q}{\epsilon_\circ}$ where Q is the net charge enclosed by the surface.
- Electric field due to a charged infinite wire : $\vec{E} = \frac{1}{2\pi\epsilon_\circ}\frac{\lambda}{r}\hat{r}$.
- Electric field due to a charged infinite plane : $\vec{E} = \frac{\sigma}{2\epsilon_\circ}\hat{n}$ ($\hat{n}$ is normal to the plane).
- Electric field inside a charged spherical shell is zero. For points outside: $\vec{E} = \frac{Q}{4\pi\epsilon_\circ r^2}\hat{r}$.
