B - PICTURES

12. tRNA

IDENTIFICATION

The given model is identified as t RNA (transfer RNA).

COMMENTS

1. t RNA was formerly referred to as sRNA (soluble RNA)
2. It is a type of RNA and has a clover leaf structure.
3. It is a small RNA molecule, typically between 70 to 90 nucleotides in length.
4. It is an adapter molecule composed of RNA that serves as the physical link between the mRNA and the amino acid sequence of proteins.
5. It transports activated amino acids from the cellular amino acid pool to the site of protein synthesis.

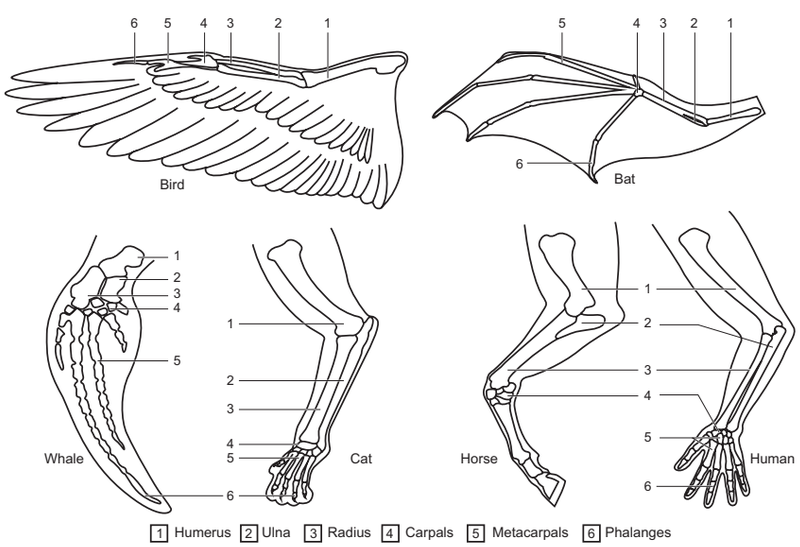

13. HOMOLOGOUS ORGANS

IDENTIFICATION

The given picture is identified as homologous organs.

COMMENTS

1. Structures which are similar in origin but perform different functions are called homologous structure. E.g. Fore limbs of terrestrial vertebrates bird, bat, whale, horse, and human.
2. The forelimbs of these organisms perform different functions, and have similar anatomical structures such as humerus, radius, ulna, carpals, metacarpals and phalanges.

3. In these animals same structures develop along different directions due to adaptations to different needs. This is referred to as divergent evolution.
