(i) break statement

The **break** statement terminates the loop containing it. Control of the program flows to the statement immediately after the body of the loop.

A **while** or **for** loop will iterate till the condition is tested false, but one can even transfer the control out of the loop (terminate) with help of **break** statement. When the break statement is executed, the control flow of the program comes out of the loop and starts executing the segment of code after the loop structure.

If break statement is inside a nested loop (loop inside another loop), break will terminate the innermost loop.

Syntax:

break

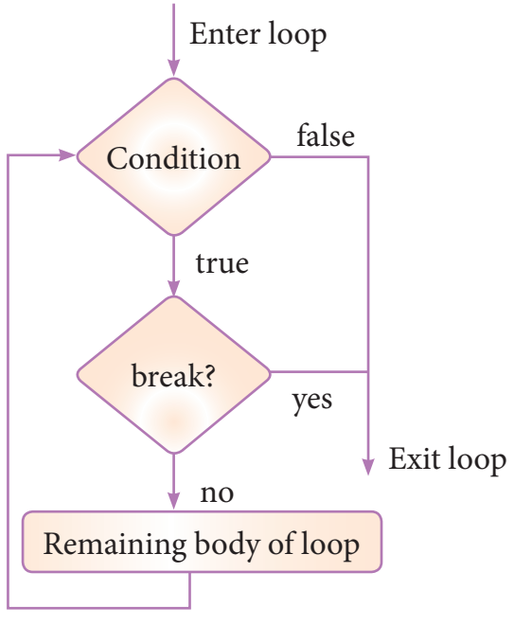

Fig 6.7 Working of break statement

The working of break statement in **for** loop and **while** loop is shown below.

```
for var in sequence:
        if condition:
                break
                #code inside for loop
#code outside for loop
while test expression:
        #code inside while loop
        if condition:
           break
        #code inside while loop
#code outside while loop
```
