Example : 7.8.1 (a) Create a Local Variable

```
def loc():
        y=0 # local scope
        print(y)
loc()
```

Output:

```
0
```

Example : 7.8.1 (b)Accessing local variable outside the scope

```
def loc():
        y = "local"
loc()
print(y)
```

When we run the above code, the output shows the following error:

The above error occurs because we are trying to access a local variable **'y'** in a global scope.

NameError: name 'y' is not defined

7.8.2 Global Scope

A variable, with global scope can be used anywhere in the program. It can be created by defining a variable outside the scope of any function.

Rules of global Keyword

The basic rules for ***global*** keyword in Python are:

- When we define a variable outside a function, it's global by default. You don't have to use global keyword.
- We use global keyword to modify the value of the global variable inside a function.
- Use of global keyword outside a function has no effect

Use of global Keyword

Example : 7.8.2 (a) Accessing global Variable From Inside a Function

```
c = 1           # global variable
def add():
        print(c)
add()
```

Output:

```
1
```
