Example 3: Code lines to delete a particular character in a string:

```
>>> str1="How are you"
>>> del str1[2]
Traceback (most recent call last):
        File "<pyshell#7>", line 1, in <module>
                del str1[2]
        TypeError: 'str' object doesn't support item deletion
```

Example 4: Code lines to delete a string variable

```
>>> str1="How about you"
>>> print (str1)
        How about you
>>> del str1
>>> print (str1)
Traceback (most recent call last):
        File "<pyshell#14>", line 1, in <module>
                print (str1)
        NameError: name 'str1' is not defined
```

8.5 String Operators

Python provides the following operators for string operations. These operators are useful to manipulate string.

(i) Concatenation (+)

Joining of two or more strings is called as Concatenation. The plus (+) operator is used to concatenate strings in python.

Example

```
>>> "welcome" + "Python"
        'welcomePython'
```

(ii) Append (+ =)

Adding more strings at the end of an existing string is known as append. The operator += is used to append a new string with an existing string.

Example

```
>>> str1="Welcome to "
```
