9.1.8 Deleting elements from a list

There are two ways to delete an element from a list viz. **del** statement and **remove()** function. del statement is used to delete elements whose index is known whereas **remove()** function is used to delete elements of a list if its index is unknown. The del statement can also be used to delete entire list.

Syntax:

del List [index of an element]
to delete a particular element
del List [index from : index to]
to delete multiple elements
del List
to delete entire list

Example

```
>>> MySubjects = ['Tamil', 'Hindi', 'Telugu', 'Maths']
>>> print (MySubjects)
        ['Tamil', 'Hindi', 'Telugu', 'Maths']
>>> del MySubjects[1]
>>> print (MySubjects)
        ['Tamil', 'Telugu', 'Maths']
```

In the above example, the list **MySubjects** has been created with four elements. print statement shows all the elements of the list. In >>> **del MySubjects[1]** statement, deletes an element whose index value is 1 and the following print shows the remaining elements of the list.

Example

```
>>> del MySubjects[1:3]
>>> print(MySubjects)
        ['Tamil']
```

In the above codes, >>> **del MySubjects[1:3]** deletes the second and third elements from the list. The upper limit of index is specified within square brackets, will be taken as -1 by the python.
