DataBase Structure

Fig 11.2

11.6 Data Model

- A data model describes how the data can be represented and accessed from a software after complete implementation
- It is a simple abstraction of complex real world data gathering environment.
- The main purpose of data model is to give an idea as how the final system or software will look like after development is completed.

11.6.1 Types of Data Model

Following are the different types of a Data Model

- Hierarchical Model
- Relational Model
- Network Database Model
- Entity Relationship Model
- Object Model

1. Hierarchical Model

Hierarchical model was developed by IBM as Information Management System.

In Hierarchical model, data is represented as a simple tree like structure form. This model represents a one-to-many relationship i.e parent-child relationship. One child can have only one parent but one parent can have many children. This model is mainly used in IBM Main Frame computers.
