Points to remember:

- DBMS is a computer based record keeping system
- Data is unprocessed data which contains any character, text, word or number has no meaning
- Information is processed data, organized and formatted.
- Examples of RDBMS are mysql, oracle, sql server, ibm db2
- Redundancy means duplication of data in a database.
- Data Consistency means that data values are the same at all instances of a database
- Data Integrity is security from unauthorized users
- Table is known a relation
- A row is called a tuple
- A column is known as an attribute
- Types of data model are Hierarchical, Relational, Network, ER and Object model.
- Hierarchical model is a simple tree like structure form with one-to-many relationship called parent-child relationship
- Relational Model represents data as relations or tables
- Network model is similar to Hierarchical model but it allows a record to have more than one parent
- ER model consists of entities, attributes and relationships
