3. It should specify the proper data type.
4. It should define the size of the data item.
5. It may define the range of values that a data item may use.
6. It may specify privacy locks for preventing unauthorized data entry.

SQL commands which comes under Data Definition Language are:

Create	To create tables in the database.
Alter	Alters the structure of the database.
Drop	Delete tables from database.
Truncate	Remove all records from a table, also release the space occupied by those records.

12.5.2 DATA MANIPULATION LANGUAGE

A Data Manipulation Language (DML) is a query language used for adding (inserting), removing (deleting), and modifying (updating) data in a database. In SQL, the data manipulation language comprises the SQL-data change statements, which modify stored data but not the schema of the database table.

After the database schema has been specified and the database has been created, the data can be manipulated using a set of procedures which are expressed by DML.

By Data Manipulation we mean,

- Insertion of new information into the database
- Retrieval of information stored in a database.
- Deletion of information from the database.
- Modification of data stored in the database.

The DML is basically of two types:

Procedural DML – Requires a user to specify what data is needed and how to get it.

Non-Procedural DML - Requires a user to specify what data is needed without specifying how to get it.

SQL commands which comes under Data Manipulation Language are :

Insert	Inserts data into a table
Update	Updates the existing data within a table.
Delete	Deletes all records from a table, but not the space occupied by them.
