| Admno | Name | Gender | Age | Place |
|---|---|---|---|---|
| 105 | Revathi | F | 19 | Chennai |
| 106 | Devika | F | 19 | Bangalore |
| 103 | Ayush | M | 18 | Delhi |
| 101 | Adarsh | M | 18 | Delhi |
| 104 | Abinandh | M | 18 | Chennai |

Note

Sorting can be done on multiple fields.

### 12.7.5.7 GROUP BY clause

The **GROUP BY** clause is used with the **SELECT** statement to group the students on rows or columns having identical values or divide the table in to groups. For example to know the number of male students or female students of a class, the **GROUP BY** clause may be used. It is mostly used in conjunction with aggregate functions to produce summary reports from the database.

The syntax for the **GROUP BY** clause is

***SELECT <column-names> FROM <table-name> GROUP BY <column-name>HAVING condition];***

To apply the above command on the student table :

**SELECT Gender FROM Student GROUP BY Gender;**

The following command will give the below given result:

| Gender |
|---|
| M |
| F |

The point to be noted is that only two results have been returned. This is because we only have two gender types 'Male' and 'Female'. The GROUP BY clause grouped all the 'M' students together and returned only a single row for it. It did the same with the 'F' students.

For example to count the number of male and female students in the student table, the following command is given :
