15.7.4 MAX() AND MIN() FUNCTIONS

The MAX() function returns the largest value of the selected column.

The MIN() function returns the smallest value of the selected column.

The following example show the highest and least average student's name.

Example 15.7.4-1

```
import sqlite3
connection = sqlite3.connect("Organization.db")
cursor = connection.cursor()
print("Displaying the name of the Highest Average")
cursor.execute("SELECT sname,max(AVERAGE)  FROM student ")
result = cursor.fetchall()
print(result)
print("Displaying the name of the Least Average")
cursor.execute("SELECT sname,min(AVERAGE)  FROM student ")
result = cursor.fetchall()
print(result)
```

OUTPUT

```
Displaying the name of the Highest Average
[('PRIYA', 98.6)]
Displaying the name of the Least Average
[('TARUN', 62.3)]
```

15.8 Updating A Record

You can even update a record (tuple) in a table through python script. The following example change the name "Priya" to "Priyanka" in a record in "student table"
