lambda	*Lambda function is mostly used for creating small and one- time anonymous function.*
LEGB rule	*Local → Enclosed → Global → Built-in scope*
List	*Mutable ordered collection of values*
local Scope	*A variable declared inside the function's body or in a block is called local scope.*
Looping	*Repetition*
Mapping	*The process of binding a variable name with an object*
Method	*A function declared and defined inside a class.*
module	*A module is a file containing Python definitions and statements. The file name is the module name with the suffix .py appended. Within a module, the module's name (as a string) is available as the value of the global variable name .*
Namespaces	*containers for mapping names of variables to objects*
Nested Block	*A block within a block is called nested block.*
next()	*The next() function returns the next item from the iterator. It can also be used to skip a row of the csv file*
Object	*Collection of Data and Functions.*
Object Oriented Programming	*Computer Programming concept based on real world objects.*
operator.itemgetter(col_ no)	*To sort by more than one column from a csv file*
os.system()	*Used to execute system command and here in our python program is used to compile the c++ program using g++*
Parameter	*Parameter is variable in the declaration of function definition.*
parse	*To split an input into pieces of data that can be easily stored or manipulated.*
pass	*Can be used as placeholder in functions and loops.*
Projection (π)	*The projection eliminates all attributes of the input relation but those mentioned in the projection list*
Prompt	*Character (<<<) displayed by the interpreter to indicate that it is ready to take input from the user.*
Pure Functions	*Pure functions always returns the same result if the same arguments are passed in*
Python prompt	>>>
