8 C. Adaptation of Halophytes – Pneumatophores of *Avicennia*

Avicennia is a plant which grows and survives in saline environment like salty lakes and sea shores (mangrove vegetation).

Diagnostic Features

- A special kind of negatively geotropic root called pneumatophores (respiratory roots) are present.
- The leaves excrete salts through the salt glands.

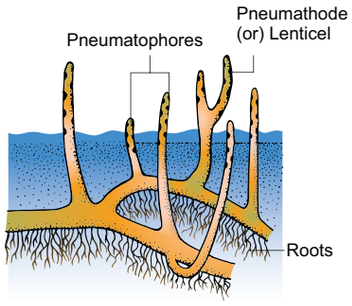

Figure 8c: Pneumatophores of *Avicennia*

8 D. Adaptation of Epiphytes – *Vanda*

Vanda is an epiphytic plant that grows perched on other plants (supporting plants). They use supporting plants only as shelter and not for water or food supply.

Diagnostic Features

- Root system is extensively developed. These roots are of two types (1) clinging roots and (2) aerial roots.
- The clinging roots fix epiphytes firmly on the surface of the supporting plant.
- Aerial roots are green coloured, hang downwardly and absorbs moisture from the atomosphere with the help of spongy tissue called velamen.

Exercise 9: Types of ovules

Aim: To recognize different types of ovules in flowering plants

Principle: To identify ovules based on the orientation, form and position of the micropyle with respect to funicle and chalaza

Requirements: Models / Photographs/ Pictures of different types of ovules.

9 A. Anatropous Ovule

Diagnostic Features

- The body of the ovule becomes completely inverted so that micropyle lies close to the funicle.
- Micropyle and chalaza lie on the same straight line. Example: Asteraceae.

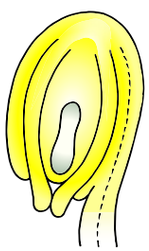

Figure 8a: Anatropous ovule

9 B. Orthotropous Ovule

Diagnostic Features

- In this type of ovule, the micropyle is at the distal end.
- The ovule is erect or straight so that the funicle, chalaza and micropyle lie on the same vertical line. Example: Piperaceae and Polygonaceae.

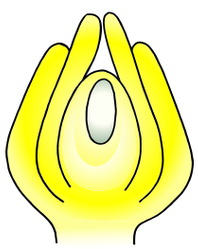

Figure 8b: Orthotropous ovule
