Construction:

- Draw a circle of 2 cm radius with O as centre.
- Mark the angles of 30º northern hemisphere and label it as C.
- Draw a line AB long to represent the equator.
- Since the meridians are to be drawn at an interval of 30º divide AB into 360/30 i.e 12 equal parts with distance of EC.
- To draw meridians, erect perpendiculars on the points of divisions of AB. Take these perpendiculars equal to the length specified for a meridian and keep half of their length on either side of the equator.
- A meridian on a globe is subtended by180º. Since the parallels are to be drawn at an interval of 30º, divide the central meridian into 180/30 i.e. 6 parts.
- Through these points of divisions draw lines parallel to the equator. These lines will be parallels of latitude. Complete the projection as shown in Figure.
