Calculation of mode for Grouped Data

Example 13.6

Calculate the mode for following data

Daily Wages	No of Workers
0 – 10	3
10 – 20	5
20 – 30	7
30 – 40	10
40 – 50	12
50 – 60	15
60 – 70	12
70 – 80	6
80 – 90	2
90 – 100	8

Solution

Daily Wages	No of Workers	
0 – 10	3	
10 – 20	5	
20 – 30	7	
30 – 40	10	
40 – 50	12 f_0	
50 – 60	15 f_1	→ Modal class
60 – 70	12 f_2	
70 – 80	6	
80 – 90	2	
90 – 100	8	

Highest Frequency = 15

Therefore 50 – 60 is the modal class

Formula

$$\text{Mode} = l + \frac{f_1 - f_0}{2f_1 - f_0 - f_2} \times c$$

Modal class is the class which has maximum frequency.

f_1 = frequency of the modal class

f_0 = frequency of the class preceding the modal class

f_2 = frequency of the class succeeding the modal class

c = width of the class limits

l = lower limit of mode interval
