$$B_S = \mu_\circ \frac{NI}{2\pi r_2}$$

The number of turns per unit length is $n = \frac{N}{2\pi r_2}$, then the magnetic field at point S is

$$B_S = \mu_\circ nI \qquad (3.52)$$

3.10 LORENTZ FORCE

When an electric charge q is kept at rest in a magnetic field, no force acts on it. At the same time, if the charge moves in the magnetic field, it experiences a force. This force is different from Coulomb force, studied in unit 1. This force is known as magnetic force. It is given by the equation

$$\vec{F} = q\left(\vec{v} \times \vec{B}\right) \qquad (3.53)$$

In general, if the charge is moving in both the electric and magnetic fields, the total force experienced by the charge is given by $\vec{F} = q\vec{E}\left(\vec{v} \times \vec{B}\right)$. It is known as Lorentz force.

3.10.1 Force on a moving charge in a magnetic field

When an electric charge q is moving with velocity $\vec{v}$ in the magnetic field $\vec{B}$, it experiences a force, called magnetic force $\vec{F}_m$. After careful experiments, Lorentz deduced the force experienced by a moving charge in the magnetic field $\vec{F}_m$

$$\vec{F}_m = q\left(\vec{v} \times \vec{B}\right) \qquad (3.54)$$

In magnitude, $F_m = qvB\sin\theta$ (3.55)

The equations (3.54) and (3.55) imply

1. $\vec{F}_m$ is directly proportional to the magnetic field $\vec{B}$
2. $\vec{F}_m$ is directly proportional to the velocity $\vec{v}$
3. $\vec{F}_m$ is directly proportional to sine of the angle between the velocity and magnetic field
4. $\vec{F}_m$ is directly proportional to the magnitude of the charge q
5. The direction of $\vec{F}_m$ is always perpendicular to $\vec{v}$ and $\vec{B}$ as $\vec{F}_m$ is the cross product of $\vec{v}$ and $\vec{B}$

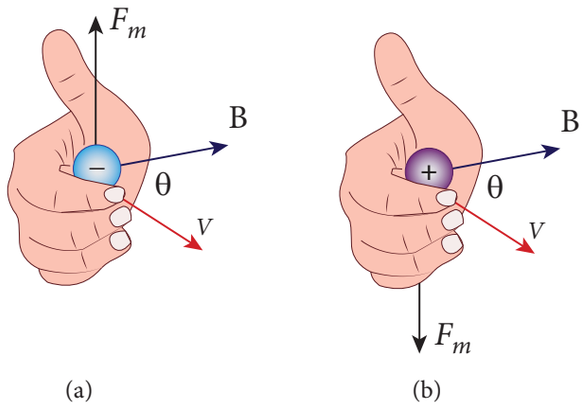

Figure 3.49 Direction of the Lorentz force on (a) positive charge (b) negative charge

7. The direction of $\vec{F}_m$ on negative charge is opposite to the direction of $\vec{F}_m$ on positive charge provided other factors are identical as shown Figure 3.49
8. If velocity $\vec{v}$ of the charge q is along magnetic field $\vec{B}$ then, $\vec{F}_m$ is zero

Definition of tesla

The strength of the magnetic field is one tesla if unit charge moving in it with unit velocity experiences unit force.

$$1\ T = \frac{1N\,s}{C\,m} = 1\frac{N}{A\,m} = 1N\,A^{-1}m^{-1}$$
